Photoshop Elements, which is a free and easy-to-use replacement for the standard Photoshop program, is a great introduction to the software. It includes many of Photoshop's tools but is not as fully featured as the full version of Photoshop. Adobe Photoshop CS4 users don't need Photoshop Elements if their photo work is at the professional or advanced level. Photoshop CS4 Premium retails for around \$300. ## Using Adobe Fireworks Fireworks (www.adobe.com/products/fireworks.html) is an excellent illustration software application that's built for creating animation, logos, buttons, and so on. You can use Fireworks to create and edit vector graphics, work with color and opacity, and use layers. Fireworks works with several popular file types, such as EPS, PDF, GIF, JPEG, PNG, and SVG. Fireworks users can create vector effects to create flawless logos, buttons, shapes, and other graphic elements. The program also provides the ability to create and edit raster graphics and edit files from Photoshop, Illustrator, Photoshop CS4, and Fireworks, as well as other programs. Fireworks works with a WYSIWYG (what you see is what you get) interface that allows you to lay down the elements of your design on your screen in a visual format, manipulate them, and then output the result into a file in any desired format (see Figure 11-2). You can use the Properties palette to manipulate layer transparency, colors, shapes, and many other details. You can also import, export, and share Fireworks files with other popular applications. FIGURE 11-2: Fireworks is useful for designing icons. ## Using Adobe Dreamweaver Dreamweaver (www.adobe.com/products/dreamweaver.html) is a powerful website-creation tool that you can use to build and manage pages that have HTML, CSS, and image code. Like other Adobe programs, Dreamweaver uses a WYSIWYG interface — the one and only type of interface you'll ever see in a web designer's programs. Dreamweaver is an extremely helpful

program, though it's not a graphics program at all, and you can't create raster images or animation. You can, however, import and export graphics, create simple animation, and include them in your website. The program is also rich with tutorials and step-by-step instructional videos

MEMPHIS, Tenn. — The same slogan that became a battle cry against the city’s entire political leadership is now being championed by popular Memphis Councilwoman Myra Thompson. “If you want to see a Memphis made over, start here,” Thompson says. “We know how to make Memphis better, we know how to make it stronger and we know how to make it a better city. We want to live in it and we want to work in it and we want our children to live in it, and we want them to have what we have.” The “make over” is happening in the city’s parks system. Memphis Forward, a reform group run by a former Memphis City Council member, launched a program to hire and train community members to be city parks workers. The idea came from Jayne Casey, a soccer mom who says she wanted to instill in her children a love of the city, but felt the public parks had fallen into disrepair. “My kids love to play in the park, but not in the areas that were safe,” says Casey. She says they decided to start with crime and vandalism prevention and added the parks director and a team of worker-council members to help turn the program around. “When I heard about this new program, it felt like how we needed to jump start and recognize what the problem was here, it became really clear to me,” said Casey. The councilwoman knows it’s a daunting task to compete with a well-established city with the backing of an organization as large as the D.C. Alliance, but she says she’s confident in the program’s potential. “There’s a lot of new leadership in Memphis right now, and with that comes a lot of enthusiasm and energy and lots of things that we haven’t done before,” Thompson says. “All of us have a lot of things to learn and we’re not afraid to do that, and that’s why we’re here, to make a difference in our

community.” The

The present invention relates to a structure for connecting one member of a ball joint assembly to another by welding. More particularly, the invention relates to a ball and socket joint for automobiles, which is joined together by welding, in order to reduce the number of parts and manufacturing costs. In the connection of one member to another by welding, it is of utmost importance that the head part of the ball joint be gripped in a predetermined location on the other member, and that the welding be conducted at a predetermined position. Otherwise, not only might there be an unsuccessful joining operation, but also there might even be an excessive welding operation, which might cause a defective joint. Under these circumstances, the inventors developed a structure for connecting one member to another by welding, which is capable of coping with possible trouble arising in a manufacturing process, as well as possible trouble arising after assembly, and which may prevent a defective manufacturing operation. One example of a known type of a structure for connecting one member to another by welding is described in Japanese Examined Patent Application Publication No. 6-3395. The ball joint described in this publication includes an outer member, a ball joint assembly, a retaining ring, and a slider. The ball joint assembly is mounted to a shaft with the retaining ring. The retaining ring engages and retains the balls on the ball joint assembly when the slider is engaged with the outer member, and the outer member fixes the ball joint assembly to the shaft. The ball joint assembly includes a housing, a ball head, a plurality of balls, and a ball seat. The housing is a metal cylinder formed in an integral structure. The ball head has an outer peripheral surface that fits into the housing. The balls are disposed between the outer peripheral surface of the ball head and the inner peripheral surface of the housing. The ball seat

is a metal ring formed in an integral structure that engages the balls and the inner peripheral surface of the housing. In this ball joint, the ball seat and the ball head are connected together by welding. Further, in order to connect the ball seat to the ball head, the ball head is engaged with the ball seat by welding along welding lines. The ball seat is pressed against the outer peripheral surface of the ball head by welding. In this ball joint, the welding process used for the ball seat and the ball head is conducted manually. Therefore, it is possible that a defective welding operation may occur. Another example of a known structure for connecting one member to another by welding is described in Japanese Unex
